Group 4

Risk Mitigation Plan

10/25/2012

ID	Risk	Mitigation
1	We could have library problems dealing with SSL pages.	This can be mitigated by research, and is not a huge issue as it's a relatively low priority story.
2	We could have communications problems between the report viewer and the web crawler.	This would be a huge issue. A backup plan might be to use python to generate JSON directly from pickled object from the web-crawler, or potentially generate on shot reports directly in the web-crawler, though these options are both less flexible.
3	Javascript is difficult to manage.	This might make coding difficult.
